

TradeSysX system summary

3EMA enter / 3EMA exit, long only

Period 2388 days **Universe** 20 tickers **Benchmark** iShares MSCI World ETF **Generated** 18 Jul 2026, 09:39

This report is generated for system evaluation and research purposes only. It presents backtested results with simulated execution and does not constitute financial advice or a recommendation to buy, sell or hold any security, or to pursue any course of action. Past performance does not guarantee future results.

Executive summary

Strategy vs benchmark

Strategy 3EMA, long only	\$165,870	20.1% CAGR	-18.9% Max DD
Buy & hold URTH	\$112,544	13.2% CAGR	-34.0% Max DD

Max DD is the maximum peak-to-trough decline in value over the holding period.

Account performance

Simulated account value (equity curve) against the buy-and-hold benchmark (dashed).

Starting balance	\$50,000
Position sizing	Total equity risk
Open trades closed	7
Average investment	\$11,871
Average equity value	\$117,386
Average cash balance	\$18,779
Average risk	\$825.99 (4.62%)
Final balance	\$165,870
CAGR	20.1%

Trade statistics

Trades	113	Best trade	+42.93 R
Winners / losers	53 / 60	Worst trade	-2.42 R
Win rate	46.9%	Avg holding (win)	327 days
R mean	+2.66	Avg holding (loss)	57 days
R standard deviation	6.83	Max win streak	8 trades
R mean (win)	+6.87	Max loss streak	9 trades
R mean (loss)	-1.05	Kelly criterion	0.39

TICKER	ENTER	EXIT	IN	OUT	DAYS	R-MULTIPLE	EXIT REASON
NVDA	2023-01-19	2025-03-07	16.73	112.52	535	+42.93	exit signal
WMT	2024-01-19	2026-06-30	52.77	113.26	613	+33.04	exit signal
TSLA	2020-05-26	2021-05-26	54.59	206.38	254	+19.26	exit signal
NFLX	2023-11-03	2025-11-05	43.24	109.85	503	+17.73	exit signal
UNH	2025-04-16	2025-04-17	565.76	439.15	2	-2.42	stop loss
XOM	2025-03-27	2025-04-04	113.21	100.19	7	-1.87	stop loss
WMT	2022-03-28	2022-05-17	46.19	41.70	36	-1.79	stop loss

Selected trades — four largest and three smallest outcomes.

Trade distribution

R-multiple of each trade in sequence (wins green, losses red) with the 30-trade rolling average.

Distribution of trade outcomes in R-multiples.

Monte Carlo simulation

Resampling the realised R-multiples over 10,000 randomised trade sequences estimates the spread of outcomes the system could produce from the same edge in a different order. Each simulated run is a sequence of complete, closed trades applied in order, each risking the per-trade amount shown in the table below — the average dollar risk from the account-value simulation.

Simulated equity paths (a subset shown) with the median outcome in purple and the buy-and-hold benchmark as the dashed grey line.

Iterations	10,000	Max drawdown (peak-to-trough)	36.8%
Risk per trade	1.65%	Minimum ending balance	\$157,362
Avg loss streak	7 trades	System quality (sim / real)	3.97 / 3.89
Max loss streak	21 trades	R-average (sim / real)	2.57 / 2.66

Benchmark — buy-and-hold (iShares MSCI World ETF – UPTH)

iShares MSCI World ETF – UPTH close price over the holding period, the buy-and-hold benchmark reference.

TICKER	BUY 2020-01-02	INVESTED	UNITS	SELL 2026-07-17	VALUE
URTH	89.70	50,000.00	557.43	201.90	112,544.37
				CAGR	13.2%

Appendix — MFE and MAE scatterplots

R-multiple vs. MAE

Each closed trade's MAE (how far it ran against you, in R) versus its realised R-multiple. The shaded band (MAE > 1 R) is the stopped-out region.

MFE vs. MAE vs. Efficiency Ratio

MFE (how far each trade ran for you) against MAE, both in R, coloured by the share of the peak kept at exit (the efficiency ratio).
