

TradeSysX system summary

3EMA enter / 3EMA exit, long only

Period 2402 days Universe 20 tickers Benchmark iShares MSCI World ETF Generated 02 Aug 2026, 11:33

This report is generated for system evaluation and research purposes only. It presents backtested results with simulated execution and does not constitute financial advice or a recommendation to buy, sell or hold any security, or to pursue any course of action. Past performance does not guarantee future results.

Executive summary

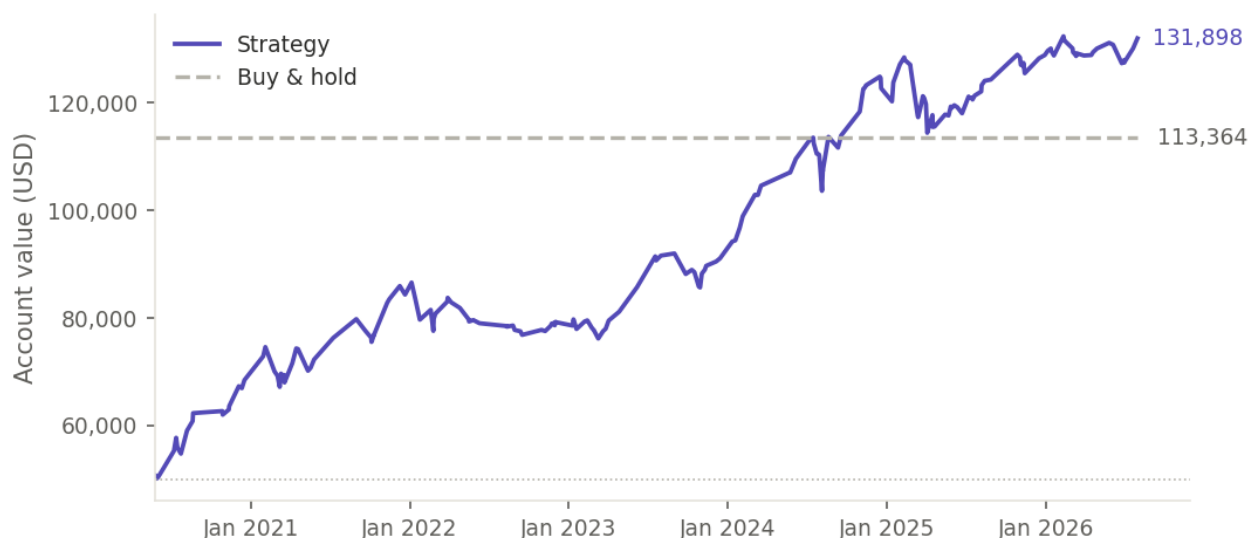

CAGR 15.9% +2.6 pts vs benchmark	FINAL BALANCE \$131,898 from \$50,000 start	SYSTEM QUALITY (SQN) 3.92 Excellent Van Tharp scale
WIN RATE 49% 115 trades · ~17/yr	MAX DRAWDOWN 12.0% strategy equity, peak-to-trough	R MEAN +2.67 avg win +6.60 · avg loss -1.06

Strategy vs benchmark

Strategy 3EMA, long only	\$131,898	15.9% CAGR	-12.0% Max DD
Buy & hold URTH	\$113,364	13.2% CAGR	-34.0% Max DD

Max DD is the maximum peak-to-trough decline in value over the holding period.

Account performance

Simulated account value (equity curve) against the buy-and-hold benchmark (dashed).

Account performance (continued)

Starting balance	\$50,000	Final balance	\$131,898
Position sizing	Core equity risk	Average monthly return	\$1,037
Open trades closed	11	Longest drawdown	527 days
Average investment	\$4,262	2022-01-03 → 2023-06-14	
Average equity value	\$96,708	CAGR	15.9%
Average cash balance	\$28,099	Sharpe ratio	1.20
Average risk	\$286.75 (1.00%)	MAR ratio	1.13

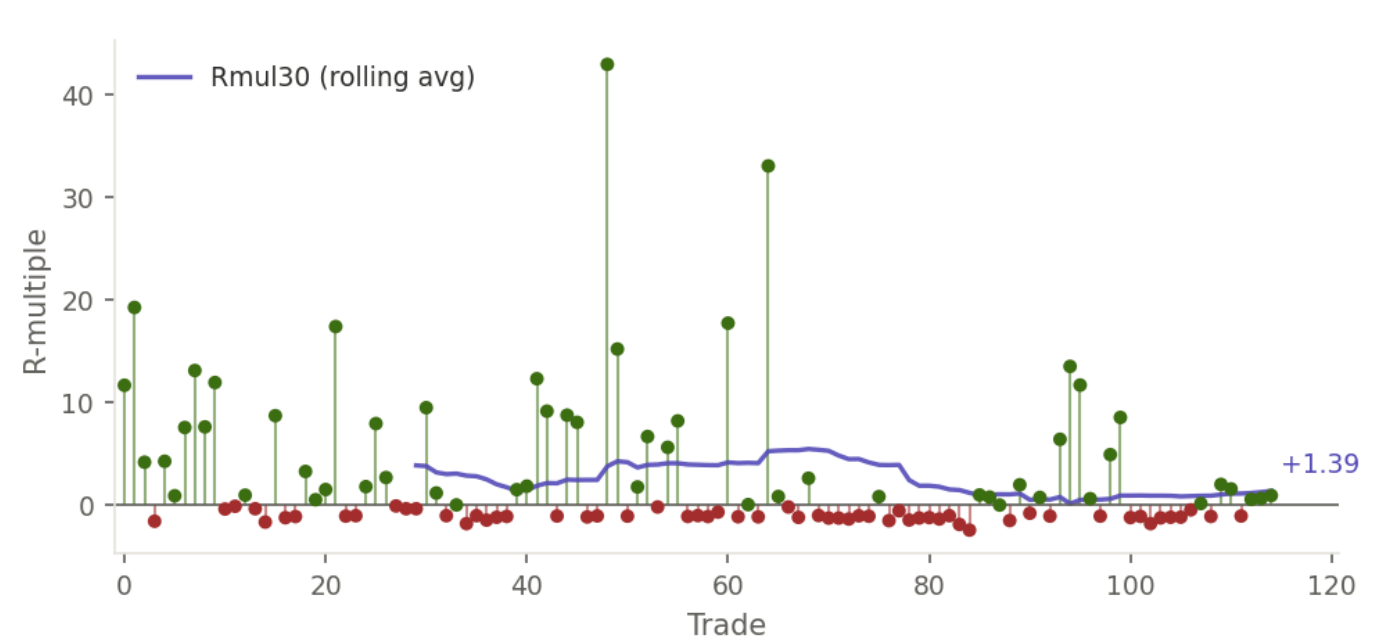

Trade statistics

Trades	115	Best trade	+42.93 R
Winners / losers	56 / 59	Worst trade	-2.42 R
Win rate	48.7%	Avg holding (win)	312 days
R mean	+2.67	Avg holding (loss)	58 days
R standard deviation	6.81	Max win streak	6 trades
R mean (win)	+6.60	Max loss streak	9 trades
R mean (loss)	-1.06	Kelly criterion	0.40

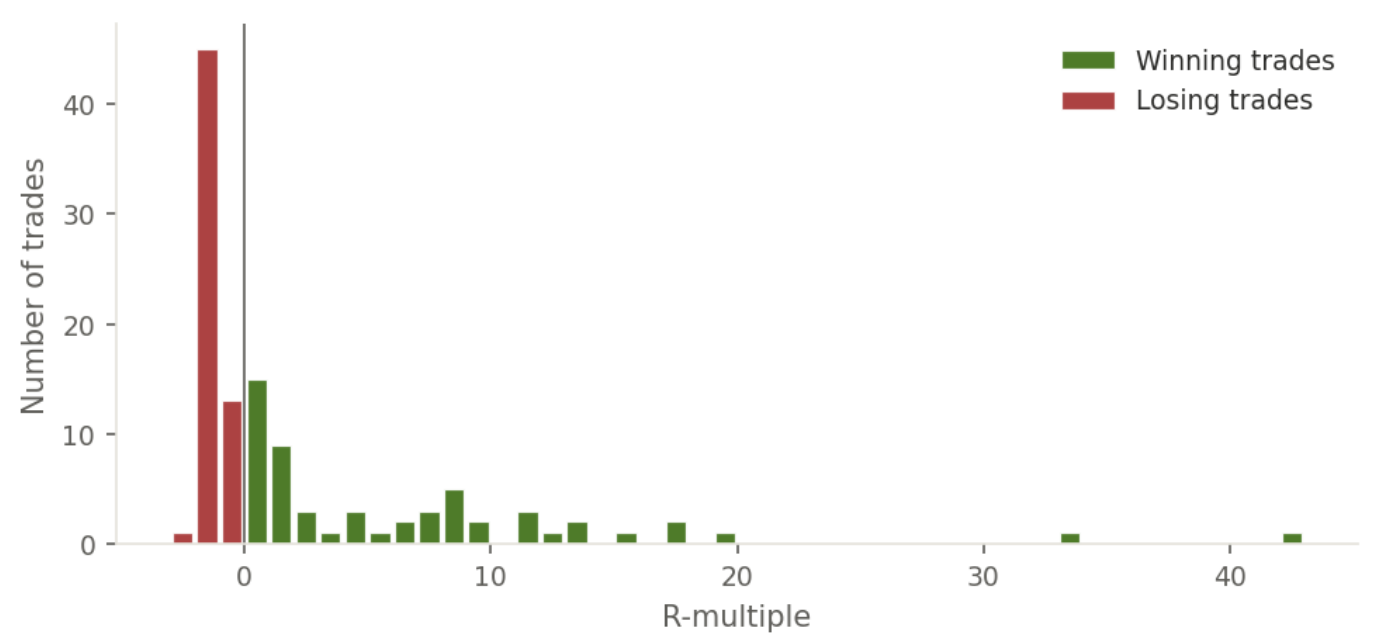

TICKER	ENTER	EXIT	IN	OUT	DAYS	R-MULTIPLE	EXIT REASON
NVDA	2023-01-19	2025-03-07	16.73	112.52	535	+42.93	exit signal
WMT	2024-01-19	2026-06-30	52.77	113.26	613	+33.04	exit signal
TSLA	2020-05-26	2021-05-26	54.59	206.38	254	+19.26	exit signal

WMT	2022-03-28	2022-05-17	46.19	41.70	36	-1.79	stop loss

Selected trades — four largest and three smallest outcomes.

Trade distribution

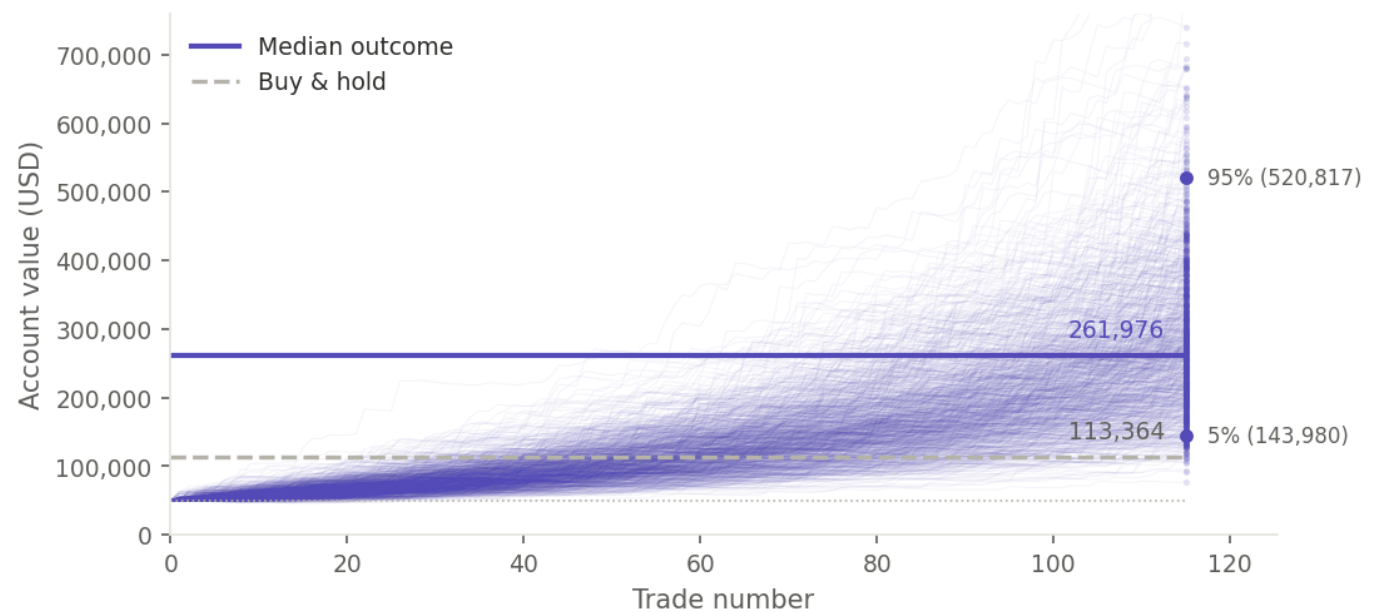

R-multiple of each trade in sequence (wins green, losses red) with the 30-trade rolling average.

Distribution of trade outcomes in R-multiples.

Monte Carlo simulation

Resampling the realised R-multiples over 10,000 randomised trade sequences estimates the spread of outcomes the system could produce from the same edge in a different order. Each simulated run is a sequence of complete, closed trades applied in order, each risking the per-trade amount shown in the table below — the average dollar risk from the account-value simulation.

Simulated equity paths (a subset shown) with the median outcome in purple and the buy-and-hold benchmark as the dashed grey line.

Iterations	10,000	Max drawdown (peak-to-trough)	18.1%
Risk per trade	0.57%	Minimum ending balance	\$76,477
Avg loss streak	6 trades	System quality (sim / real)	4.00 / 3.92
Max loss streak	19 trades	R-average (sim / real)	2.59 / 2.67

Benchmark — buy-and-hold (iShares MSCI World ETF – URTH)

iShares MSCI World ETF – URTH close price over the holding period, the buy-and-hold benchmark reference.

TICKER	BUY 2020-01-02	INVESTED	UNITS	SELL 2026-07-31	VALUE
URTH	89.70	50,000.00	557.43	203.37	113,363.79
				CAGR	13.2%

Appendix — account performance (detailed)

Daily equity curve against the buy-and-hold benchmark (top), the drawdown from the running equity peak in percent, the trailing one-year return in dollars and the monthly return in dollars (bottom).

Distribution of monthly returns in dollars, with the mean (dashed).

Portfolio composition and open positions

As at 2026-07-31 • equity 131,898 • 11 open positions (20 quotes total)

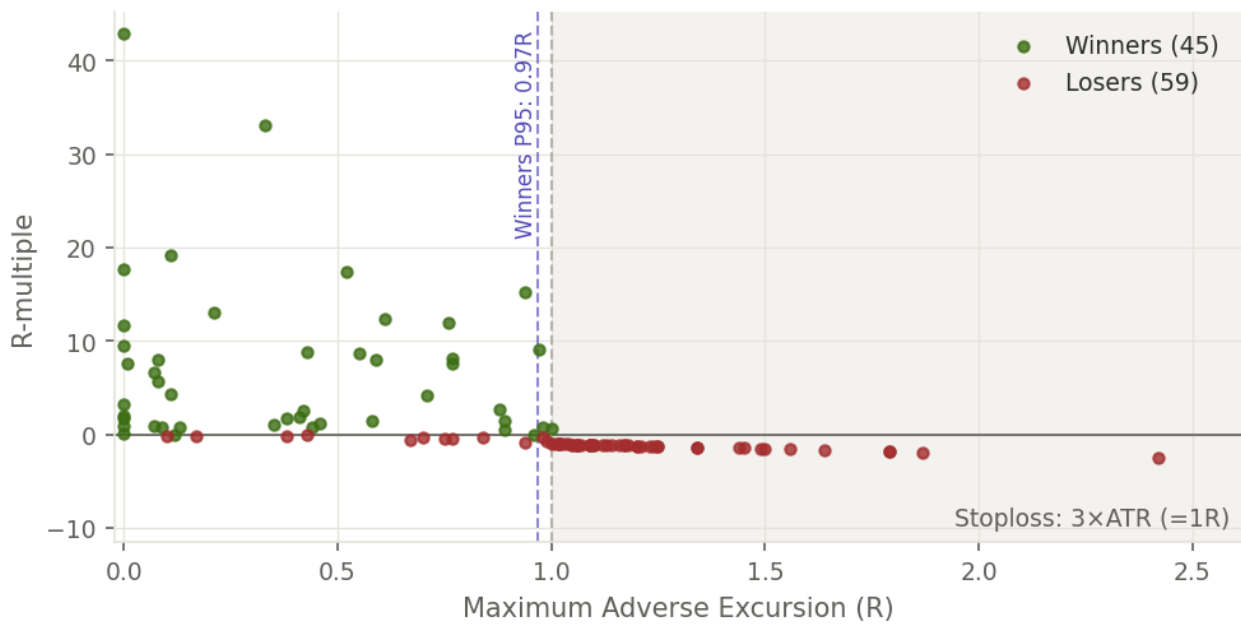

open gain under 1R (4 of 11)

How the account's equity stood at the last close: its split over the open positions and the cash balance (top), then each position's last close and one-day move, market value and open profit. Green is an open gain, red an open loss; an amber dot marks a position still running under 1 R.

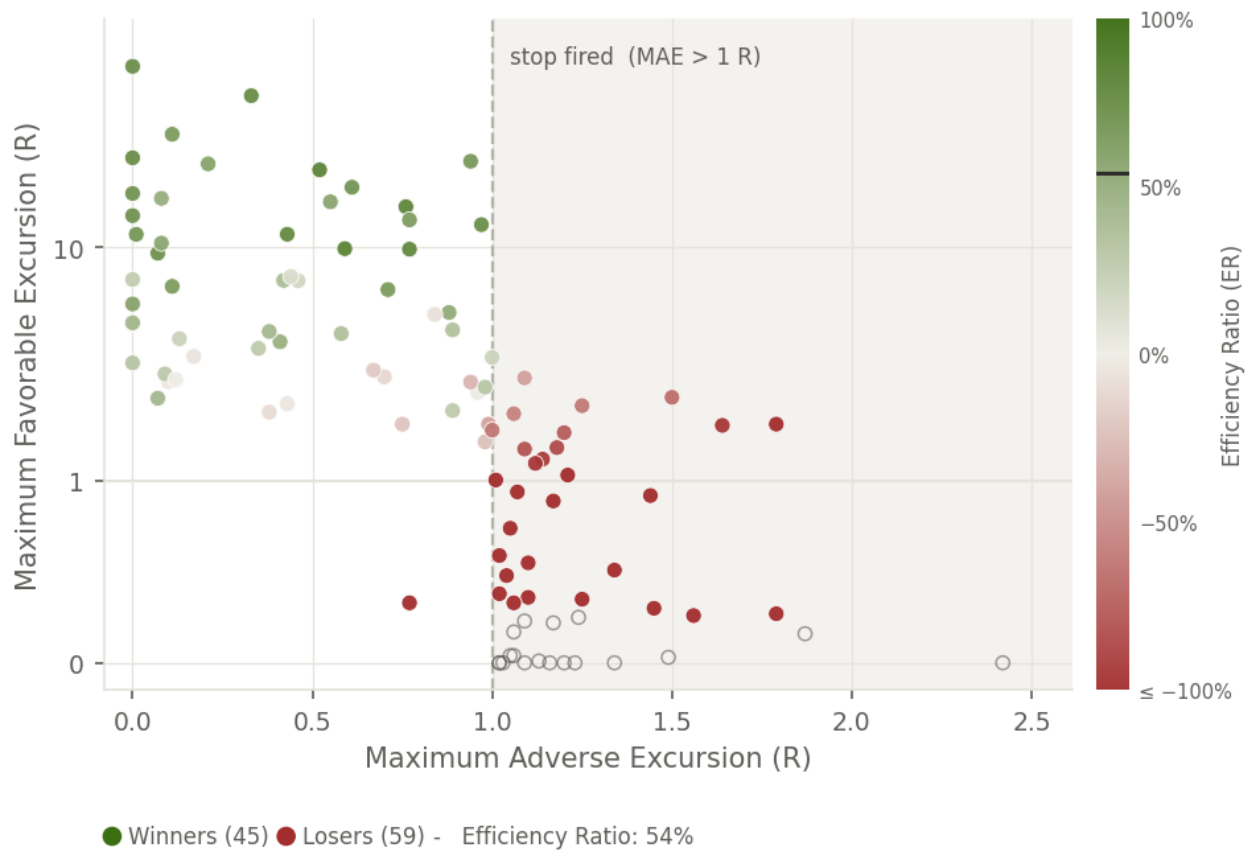

Appendix — scatterplots

R-multiple vs. MAE

Each closed trade's MAE (how far it ran against you, in R) versus its realised R-multiple. The shaded band (MAE > 1 R) is the stopped-out region.

MFE vs. MAE and Efficiency Ratio

MFE (how far each trade ran for you) against MAE, both in R, coloured by the share of the peak kept at exit (the efficiency ratio).
